

WEEK 4

Microservices with Spring Boot 3 and Spring Cloud

Creating Microservices for account and loan

OUTPUT:

The screenshot displays an IDE (IntelliJ IDEA) with the 'AccountApplication.java' file open. The code defines a Spring Boot application package 'com.cognizant.account' and a class 'AccountApplication' that implements 'SpringBootApplication'. The application is running, and the console shows the following output:

```
2026-07-13T10:37:52.585+05:30 INFO 18352 --- [account] [ restartedMain] c.cognizant.account
2026-07-13T10:37:52.590+05:30 INFO 18352 --- [account] [ restartedMain] c.cognizant.account
2026-07-13T10:37:52.742+05:30 INFO 18352 --- [account] [ restartedMain] .e.DevToolsPropertyI
2026-07-13T10:37:52.743+05:30 INFO 18352 --- [account] [ restartedMain] .e.DevToolsPropertyI
```

The browser window shows the REST API output for the endpoint 'localhost:8080/accounts/00987987973432'. The output is a JSON object:

```
{
  "number": "00987987973432",
  "type": "savings",
  "balance": 234343
}
```
